Abstract—Internet voting systems have gained popularity and have been used for government elections, any public or private organization's election. This project deals with the design, building and testing of online voting system that allows users and election representatives to participate in the online voting. This online voting system is highly secured and its user interface is very simple and also reliable. This will help the users to select their candidates accurately.

Index Terms—internet voting system, election, user, evoting

I. INTRODUCTION

Online Voting System is the computerized voting system introduced. It enables the voters to vote through computers and view the result in web browser. Online Voting are simple, attractive and easy to use. It reduces manual efforts and bulk of information can be handled easily. The risk of error in vote-tallying can also be largely eliminated. In this proposed system, the Internet is changing citizen expectations around the speed and convenience with which all government services and elections should be delivered. s. Since 2004, when Elections BC introduced North America's first fully integrated online voter registration service, British Columbians have also been using the Internet to register to vote. It is natural that citizens are asking when they will be able to vote online, especially given that banking and other transactions requiring security to protect personal information are now routinely performed in the virtual world.

II. LITERATURE REVIEW

Use of online voting has the capability to reduce or remove unwanted human errors. IT is reliable, scalable that it can be expanded as per need. Online voting system does not concern with its geographical location of the voters. Type of voting system till now has been implemented as: Paper Ballot Voting System - It includes casting the vote using the paper and the stamp. Each voter uses one ballot, and ballots are not shared. The voter casts his/her vote in a box at the polling station. Disadvantage is Time Consuming, Booth Capture, Low Tally Speed, etc. therefore it is not successful at large scale. Electronic voting machine – It is a type of voting system which uses electronic machine that would allow voters to broadcast their secret vote ballot to election officials over the internet. Due to big cost, high power, vulnerable in security, etc has reduced its usage.

III. PROPOSED METHODOLOGY

This Electronic voting system is very useful one in Election. E-Voting System is a digital electronic system that user data is collected in digital manner and processed securely. Security is the important factor in this system. Every voter should have a personal identification number. This number will be automatically checked along with the ID stored on the database.

IV. FEATURES

- 1 .Online voting systems in real time.
2. For this project HTML, CSS and PHP have been used.
3. Online voting has many languages for all types of people

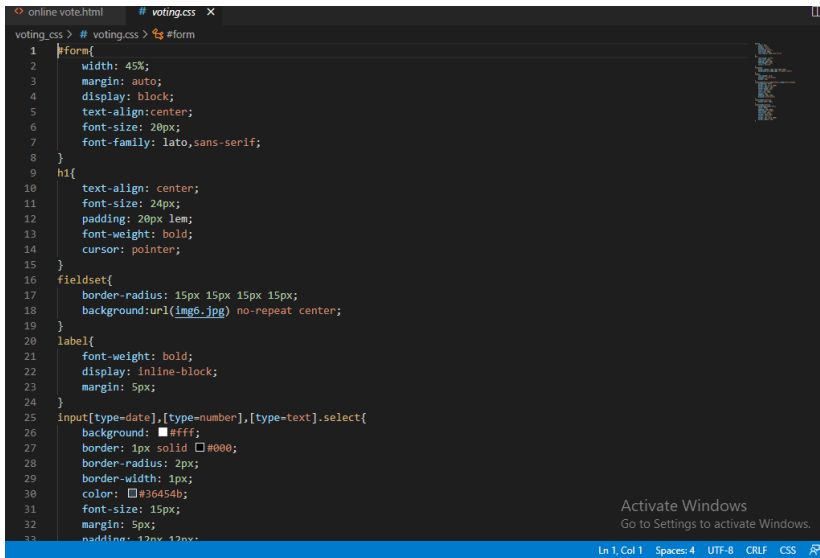

Fig. 1. HTML Code.

V. CONCLUSION AND FUTURE WORK

In this report an analysis of existing e-voting schemes along with their scopes and limitations has been discussed. Although e-voting scheme proposed in fulfills all the essential requirements of voting, a further investigation over there is a demand of secure e-voting protocol. If the secure implementation of

A screenshot of a code editor window with a dark theme. The editor shows CSS code for a voting form. The code is organized into sections: a form container, a heading, a fieldset, a label, and a select input. The form container has a width of 45%, auto margin, block display, centered text, 20px font size, and Lato sans-serif font family. The heading is centered, 24px font size, 20px padding, bold, and has a pointer cursor. The fieldset has a 15px border radius and a background image. The label is bold, inline-block, and has a 5px margin. The select input has a white background, 1px solid black border, 2px border radius, 1px border width, #36454b color, 15px font size, 5px margin, and 12px padding. The editor interface includes a top bar with file names, a left sidebar with a file tree, and a bottom status bar showing 'Ln 1, Col 1', 'Spaces: 4', 'UTF-8', 'CRLF', 'CSS', and an 'Activate Windows' watermark.

```
1 #form{
2   width: 45%;
3   margin: auto;
4   display: block;
5   text-align:center;
6   font-size: 20px;
7   font-family: lato,sans-serif;
8 }
9 h1{
10  text-align: center;
11  font-size: 24px;
12  padding: 20px 1em;
13  font-weight: bold;
14  cursor: pointer;
15 }
16 fieldset{
17  border-radius: 15px 15px 15px 15px;
18  background:url(img6.jpg) no-repeat center;
19 }
20 label{
21  font-weight: bold;
22  display: inline-block;
23  margin: 5px;
24 }
25 input[type=date],[type=number],[type=text].select{
26  background: #fff;
27  border: 1px solid #000;
28  border-radius: 2px;
29  border-width: 1px;
30  color: #36454b;
31  font-size: 15px;
32  margin: 5px;
33  padding: 12px 12px;
```

Fig. 2. CSS Code.

e-voting schemes can be ensured, people will be benefited extremely by this popular social application of cryptography.

ACKNOWLEDGMENT

I would like to thank my honourable **Khan Md. Hasib Sir** for his time, generosity and critical insights into this project.
